OIL & GAS

Oil and gas automation, also known as oilfield automation, in the oil and gas industry refers to a growing number of processes, many involving digital technologies, that can help energy producers better compete in global markets. While some industry areas are riper for automation than others, top oil and gas automation candidates include drilling, production operations and process control, logistics and supply chain, safety and retail operations.

SPECIFICATIONS :

Oil and gas applications includes

- Sulphur and Argon recovery
- Mud & cement pumping
- BOP (Blowout protection unit) & Top drive control
- Storage of natural gas and dispensing stations
- Compression at pump station
- Monitoring flow and distribution at dispensing stations of natural gas, petrol & diesel.

Some of the applications were executed in extreme conditions of oil rigs at off-shores. We are also available to provide our services for maintenance, program development, modification & commissioning of control systems at off-shore and on-shore rigs.
